

LitQuest

Demo

LitQuest is an interactive web application designed to address adult literacy challenges by modernizing classic literature. Created within 24 hours during SparkHacks 2026, the project directly responds to data from the National Literacy Institute showing that 54% of adults read below a 6th-grade level, with 20% reading below a 5th-grade level. To combat the drop in reading engagement caused by modern social media habits, LitQuest transforms classic novels into gamified visual novels featuring adaptive vocabulary. This approach preserves the critical thinking and storytelling value of classic literature while making it accessible and engaging for readers of all skill levels. Built using React and JavaScript for the frontend, MongoDB for backend data management, and designed in Figma, LitQuest demonstrates how interactive technology can foster accessible digital learning.
